

SCALEBLASTER®

WATER CONDITIONER

APPLICATIONS

Sustainable Solutions to Hard Water Problems

CLM-504

Bakeries

Baking Industry Applications

Corrective actions are often taken by bakers to counteract existing water conditions. These actions usually involve the adjustment of ingredients or other factors, since the introduction of softeners and/or chemical treatment are considered to be very undesirable for many reasons, not the least of which is the effect on product taste. **ScaleBlaster** can offer a completely non-chemical way to accept the positive effects of hard water on baked goods and avoid the negative effects of softening, allowing you to bake as you intend to.

- **ScaleBlaster** will protect steam ovens, proofers, bagel making equipment, any water-fed equipment including hot water heaters, boilers, and HVAC steam-based baking equipment against scale, corrosion, and hard water.
- Protection from scale build-up extends the lifecycle of this equipment and protects your capital investment. Equipment works more efficiently and lasts longer with **ScaleBlaster**.
- Hard water is especially damaging on booster heaters, dish machines, steamers, proofers, combination ovens, rack ovens, and deck ovens.
- Any water-fed equipment that requires high temperatures creates a "scale-friendly" environment. High temperatures cause the hard minerals in water to demulsify, creating solid scale depositors. Scale can act as an insulator, causing heating elements to fail, or clog water lines that can starve equipment of needed water.
- By virtually eliminating the scale buildup caused by the calcium and magnesium in hard water, **ScaleBlaster** increases both the life and efficiency of your equipment.

Maintenance Free

The **ScaleBlaster** water conditioning system requires no maintenance, thus eliminating maintenance costs.

Environmentally Friendly

There are no harmful chemicals or salts which dispose chlorides into the environment.

Space Efficiency

The unit takes up little space. Simply mount the **ScaleBlaster** water conditioner on your incoming pipes and you are good to go.

Commercial buildings may be susceptible to problems with hard water, but you now have an effective solution to prevent it.
